1. What are they?

AsciiDoctorJ Panels are a way of creating a panel that is clickable. Now you can create a set of panels that link to various contents, an alternative way of building links.

2. How to use?

AsciiDoctorJ Panels are built using a block processor. So you will need to create blocks to visualize them. For the most part, the body of the panel is built using a Kotlin DSL.

2.1. First Example

The first type of panels is just panels with a list of panel objects. See example below

```
{
  "buttons": [
    {
      "link": "http://www.google.com",
      "label": "Google Search"
    }
  ]
}
```

Given the above, we will build panels for Google, Apple, Microsoft, Amazon, Netflix

```

The syntax is pretty small to make a panel of buttons.

3. Round Buttons

Similar to the buttons, we have a round object we can use.

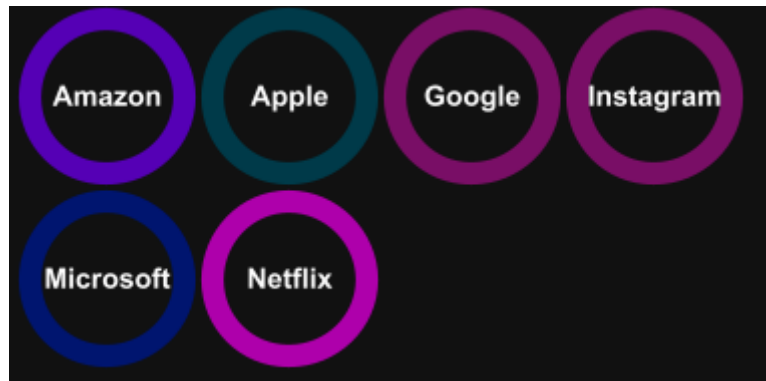

```

With theme, you can control the colors, the number of columns, scaling the svg output and update the style for the text displayed.

10. Timeline Builder

A timeline can be created with a simple text markup with an asciidoctor block macro. The macro would look like this `[timeline,title="Demo timeline Builder by docops.io",scale="0.7",role="center"]`

- **timeline** is the macro to be used
- **title** is title of the timeline image
- **scale** is a decimal value on how to scale(zoom) the image 1.0 is default
- **role** for aligning *left*, *center*, *right*

Each entry inside the macro consists of an array delimiter (-), a date: key and a text: key. Similar to the example below. Repeat those three elements as needed.

In addition, the text value can contain http links, but the format needs to be `[[https://website display]]`

- First part is the url and second part is the display link label.

```
-  
date: TBD  
text: xyz
```
